

AI E-commerce Optimization Platform

Demo MVP Scope

1. Demo Objective

Build a lightweight AI-powered e-commerce optimization platform that demonstrates:

Shopify data → AI analysis → actionable business recommendations

The demo should make a potential client understand the product within **5–10 minutes**.

2. Demo Flow

The complete demo flow should be:

```
graph TD;
  A[Login] --> B[Connect / Select Shopify Store];
  B --> C[Dashboard];
  C --> D[AI analyzes store data];
  D --> E[AI Recommendations];
  E --> F[Recommendation Details];
  F --> G[Suggested Action];
```

For the demo, Shopify data can be **real or mocked**, depending on development time.

3. Features Required

A. Login

Simple authentication screen.

For demo purposes:

- Email
- Password
- Login

No need for:

- Complex user roles
 - Team management
 - SSO
 - Advanced account settings
-

4. Shopify Connection

Create a simple **Connect Shopify** experience.

For the demo, this can either:

Option A — Real Shopify connection

Connect to a development Shopify store and pull basic data.

Option B — Demo mode

Use preloaded/mock Shopify data.

Recommended for the client demo:

Support a demo store with realistic data.

The UI can still show:

Shopify Connected ✓

This ensures the demo is reliable even without depending on a live Shopify account.

5. Dashboard

The dashboard only needs a few key metrics.

KPI Cards

- Revenue
- Orders
- Average Order Value
- Customers

Example:

Revenue	\$124,820
Orders	2,184
AOV	\$57.15
Customers	1,842

AI Summary

Show something like:

AI analyzed your store and identified 7 opportunities.

Then display the top 3–5 recommendations.

6. AI Recommendations

This is the **main feature of the demo**.

Create recommendation cards such as:

Recommendation 1 — Pricing

Increase Product X price by 5%

Show:

- Current price
 - Suggested price
 - Relevant sales data
 - AI explanation
 - Confidence
-

Recommendation 2 — Product Performance

Product Y has declining performance

Show:

- Revenue change
 - Sales change
 - Previous vs current period
 - AI explanation
 - Suggested action
-

Recommendation 3 — Cross-Sell

Customers buying Product X are likely to buy Product Y

Show:

- Number of relevant customers
 - Products
 - AI-generated recommendation
 - Suggested campaign
-

Recommendation 4 — Inventory

Product Z may run out of stock soon

Show:

- Current inventory
 - Sales velocity
 - Estimated days remaining
 - Recommended action
-

Recommendation 5 — Customer Campaign

Target customers who purchased X but haven't purchased Y

Show:

- Audience size
 - Recommended product
 - Suggested offer
 - Suggested campaign message
-

7. Recommendation Detail

Clicking a recommendation opens a detail page/modal.

Keep it simple:

Product X – Pricing Opportunity

Recommendation
Increase price by 5%

Why?
Sales have increased 14% while demand remains strong and discounting has decreased.

Supporting Data
Revenue +18%
Units Sold +11%
Discounts -8%

AI Suggested Action
Test a 5% price increase.

[Mark as Done] [Dismiss]

The important part is showing **why the AI made the recommendation**.

8. AI Chat — Demo Feature

Include a small AI chat panel if time permits.

Example questions:

Which products should I focus on?

Why are sales declining?

Who should I target with a campaign?

What should I do this week?

The AI responds using the demo store's dataset.

This provides a strong demonstration of the conversational AI layer without building a complete AI agent.

9. Data Required

Only prepare enough data to make the demo believable.

Products

- Product name
- Price
- Units sold
- Revenue
- Inventory

Orders

- Order date
- Customer
- Products
- Revenue

Customers

- Customer
- Orders
- Total spend
- Products purchased

Reviews

- Rating
- Review text

That's enough for the demo.

10. AI Logic

Do **not** build sophisticated ML infrastructure for the demo.

Use a combination of:

Basic analytics/rules

For example:

```
Revenue ↓ significantly
+
Orders ↓
+
Traffic/other available metric stable
=
Potential conversion problem
```

LLM

Use the LLM to:

- Explain findings
- Generate recommendations
- Generate campaign ideas
- Summarize reviews
- Answer questions about the data

This creates the appearance and experience of an intelligent optimization platform without over-engineering the backend.

11. Demo Data

Prepare **one realistic Shopify store dataset**.

Example store:

Fashion / Apparel

Products:

- Premium Hoodie
- Running Shoes
- Denim Jacket
- Cotton T-Shirt
- Leather Backpack
- Running Socks
- Sports Cap
- Travel Bag

Create enough historical data to demonstrate:

- Increasing products
- Declining products

- Cross-sell relationships
- Low inventory
- Customer segments
- Review problems

The data should intentionally contain **clear business opportunities** so the AI has something meaningful to identify.

12. Pages Required

Only build these screens:

1. Login
2. Dashboard
3. Recommendations
4. Recommendation Detail
5. AI Chat
6. Basic Settings / Shopify Connection

That's sufficient for the demo.

13. Explicitly Exclude From Demo MVP

Do **not** spend time building:

- Production-grade Shopify synchronization
- Multiple Shopify stores
- Meta Ads integration
- Google Ads integration
- Klaviyo integration
- Email sending
- Automatic price changes
- Automatic campaign execution
- Advanced forecasting
- Competitor analysis
- Complex customer segmentation
- Custom ML models
- Mobile application
- Billing/subscriptions

- Team management
- Advanced permissions
- Enterprise security
- Complex analytics/report builder
- Full marketing automation

These are post-demo features.

14. Suggested Demo Architecture

Keep the architecture simple:

15. Definition of Done

The demo MVP is complete when a client can see this journey:

```
"Connect Shopify"
  ↓
"My store has $124K revenue"
  ↓
"AI found 5 opportunities"
  ↓
"Product X should potentially increase in price"
  ↓
"Here is the data supporting that recommendation"
  ↓
"Here is a customer segment I can target"
  ↓
"Here is the campaign the AI recommends"
  ↓
"Let me ask the AI what I should do next"
```

The **AI Recommendations screen** is the **centerpiece** of the demo.

16. Priority

P0 — Must Have

1. Login
2. Demo Shopify/store data
3. Dashboard
4. AI recommendation engine
5. 4–5 recommendation types
6. Recommendation detail view
7. Clean, polished UI

P1 — Nice to Have

1. AI chat
2. Shopify OAuth
3. Review analysis

P2 — Do Not Build for Demo

Everything else.

Demo MVP in One Sentence

A polished Shopify dashboard that uses AI to analyze store data and tell merchants what they should optimize next—with evidence and actionable recommendations.
